

# Introduction to the NI Real-Time Hypervisor

2009 NI Technical Symposium

# Agenda

- 1) NI Real-Time Hypervisor overview
- 2) Basics of virtualization technology
- 3) Configuring and using Real-Time Hypervisor systems
- 4) Performance and benchmarks
- 5) Case study: aircraft arrestor system

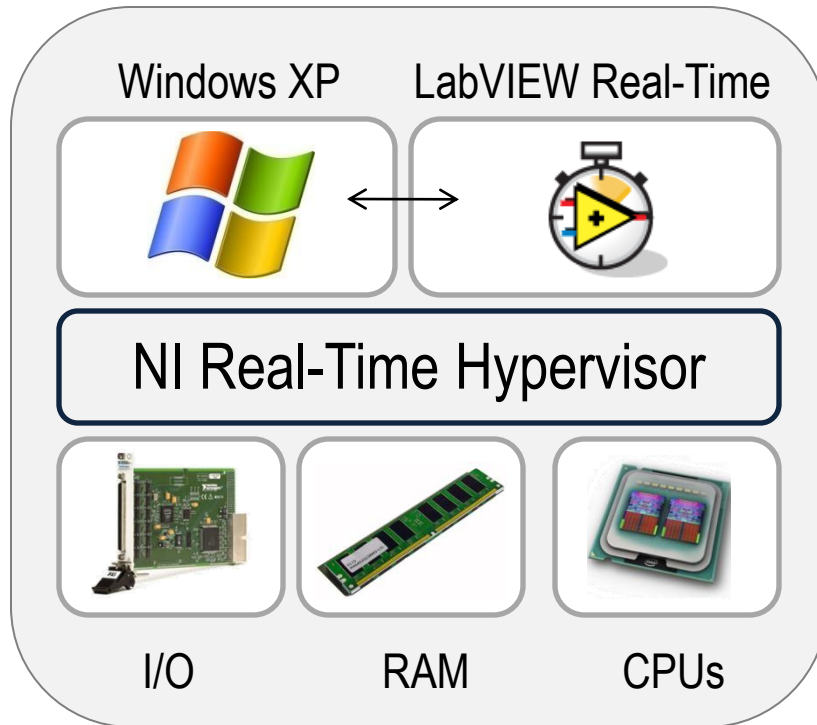

# NI Real-Time Hypervisor Overview

2009 NI Technical Symposium

# NI Real-Time Hypervisor

- Run NI LabVIEW Real-Time and Windows XP in parallel
- Partition I/O devices, RAM, and CPUs between OSs
- Uses virtualization technology and Intel VT

# Benefits of the Real-Time Hypervisor

- Capability: make use of real-time processing and Windows XP services

Applications

Graphics

Services

Determinism

Real-Time I/O

Timing

# Benefits of the Real-Time Hypervisor

- Consolidation: reduce hardware costs, wiring, and physical footprint

Virtualized System with NI Real-Time Hypervisor

# Benefits of the Real-Time Hypervisor

- Efficiency: take advantage of multicore processors effectively

Quad-Core Controller with Virtualization

Windows XP

LabVIEW Real-Time

# Basics of Virtualization Technology

2009 NI Technical Symposium

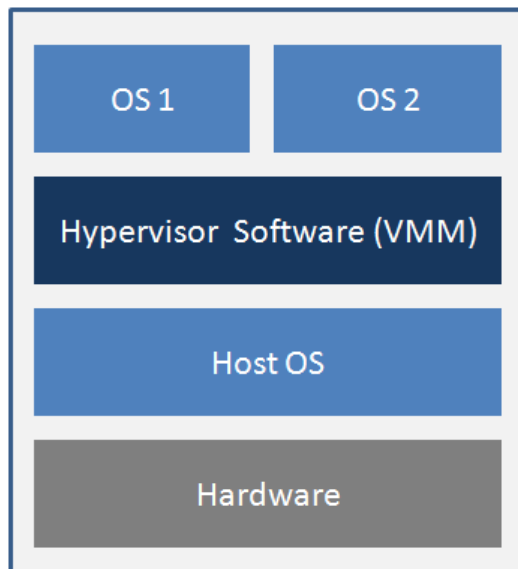

# What Is Virtualization?

- **The term:** refers to abstraction of OSs from hardware resources
- **In practice:** running multiple OSs simultaneously on a single computer

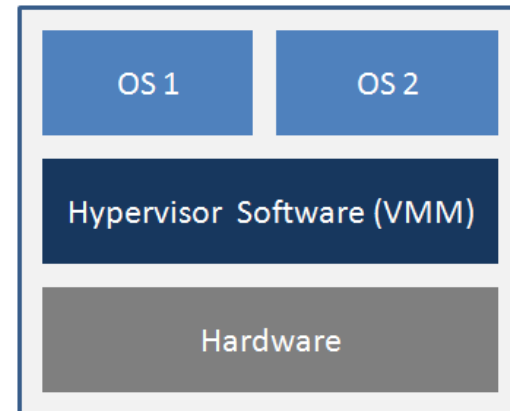

# Virtualization Software Architectures

- Software: virtual machine monitor (VMM) or Hypervisor
- Two main variations: hosted and bare-metal

Hosted (VMWare)

Bare-Metal (NI Real-Time Hypervisor)

# How Does Virtualization Software Work?

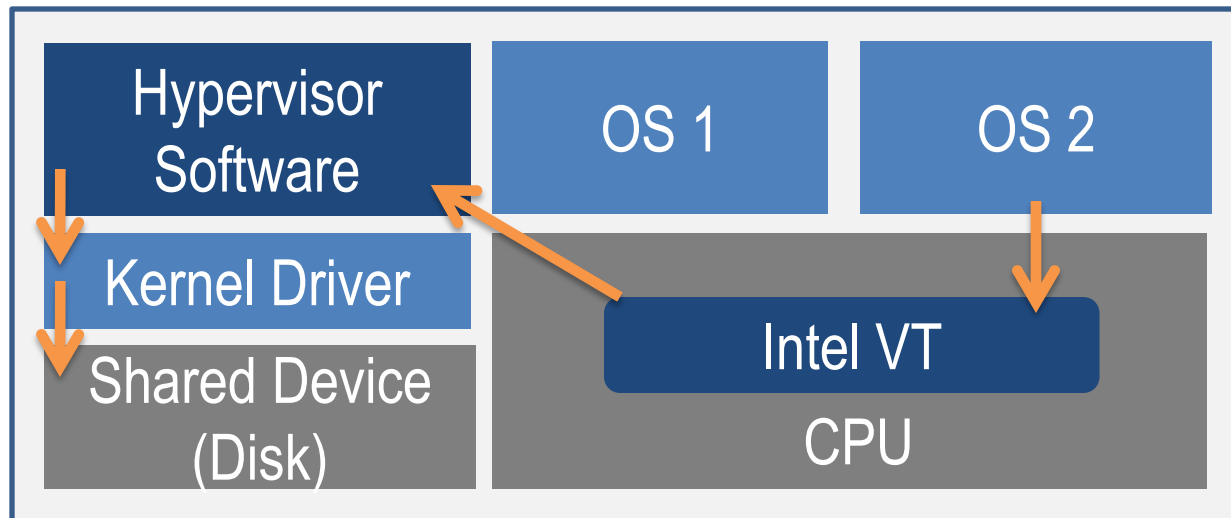

- OSs are “unaware” of being virtualized
- Hypervisor is called only when needed
- Various mechanisms for calling the hypervisor (hardware assist with Intel VT or binary translation)

Hypervisor goal: facilitate simultaneous operation of OSs and protect access to shared system resources

# Example: Accessing Shared I/O Devices

- OS 2 attempts to transfer data to disk
- Processor with Intel VT calls hypervisor
- Hypervisor writes to disk using its own driver

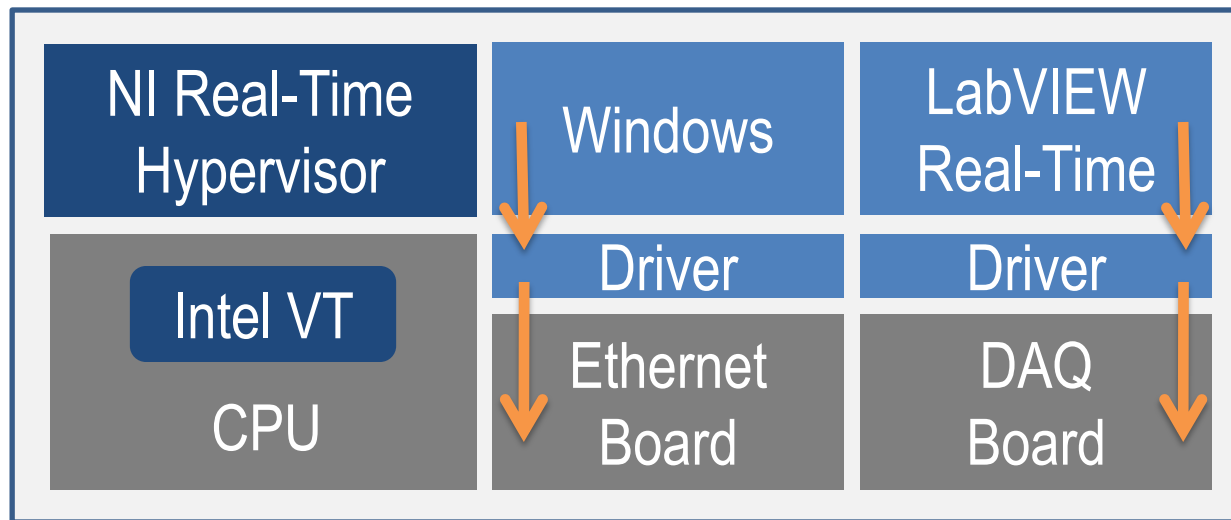

Note: NI Real-Time Hypervisor does not typically do this; devices are partitioned rather than shared

# Example: Accessing Partitioned I/O Devices

- NI Real-Time Hypervisor allows OSs to communicate directly with partitioned I/O boards

# Configuring and Using Real-Time Hypervisor Systems

2009 NI Technical Symposium

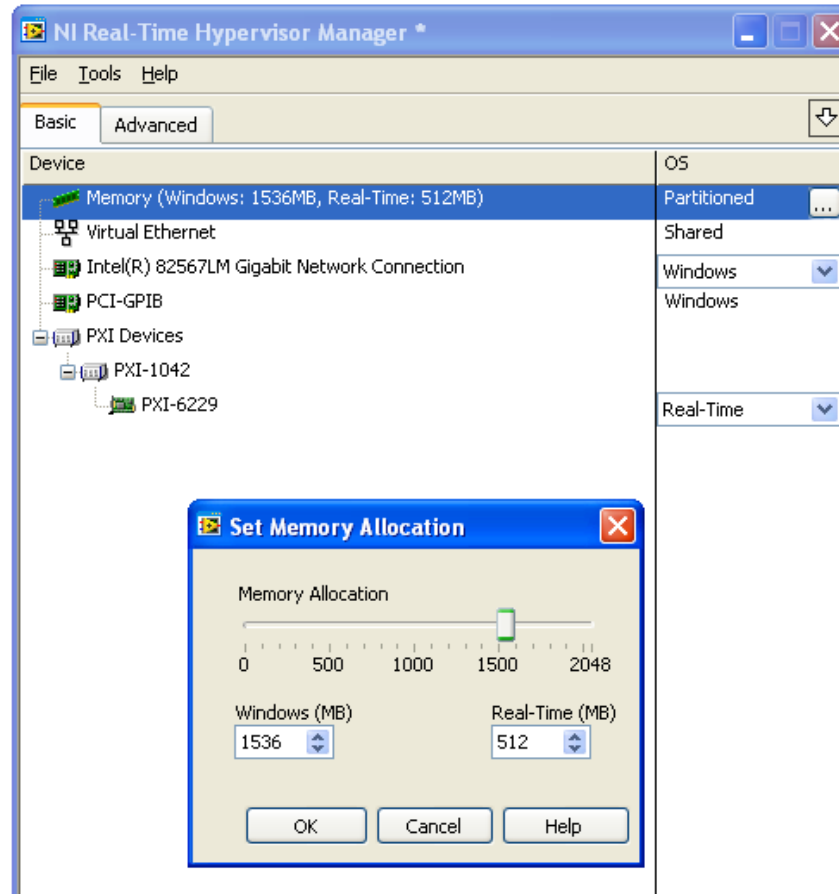

# Using NI Real-Time Hypervisor Systems

- **Configuration:** NI Real-Time Hypervisor Manager
- **Communication:** virtual Ethernet and virtual console
- **Development and Deployment:** similar to traditional real-time systems

# Assigning I/O and RAM between OSs

# Demo: Configuring a Real-Time Hypervisor System

# Booting Into the Hypervisor

NI Real-Time Hypervisor GRUB 2009 (Based on GRUB version 0.97) (623K lower / 2057152K upper memory)

Microsoft Windows

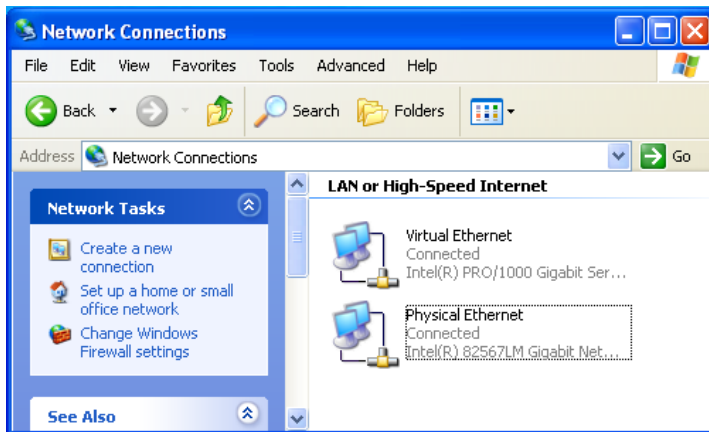

NI Real-Time Hypervisor

Use the ↑ and ↓ keys to select which entry is highlighted.  
Press enter to boot the selected OS, 'e' to edit the  
commands before booting, or 'c' for a command-line.

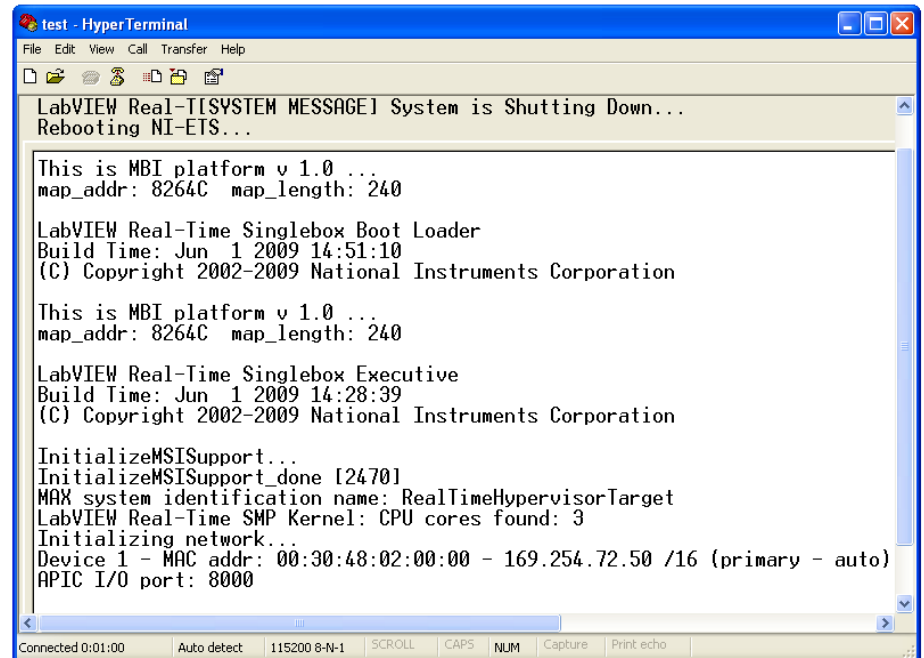

# Communicating between OSs

Virtual Ethernet

Virtual Console (COM 4)

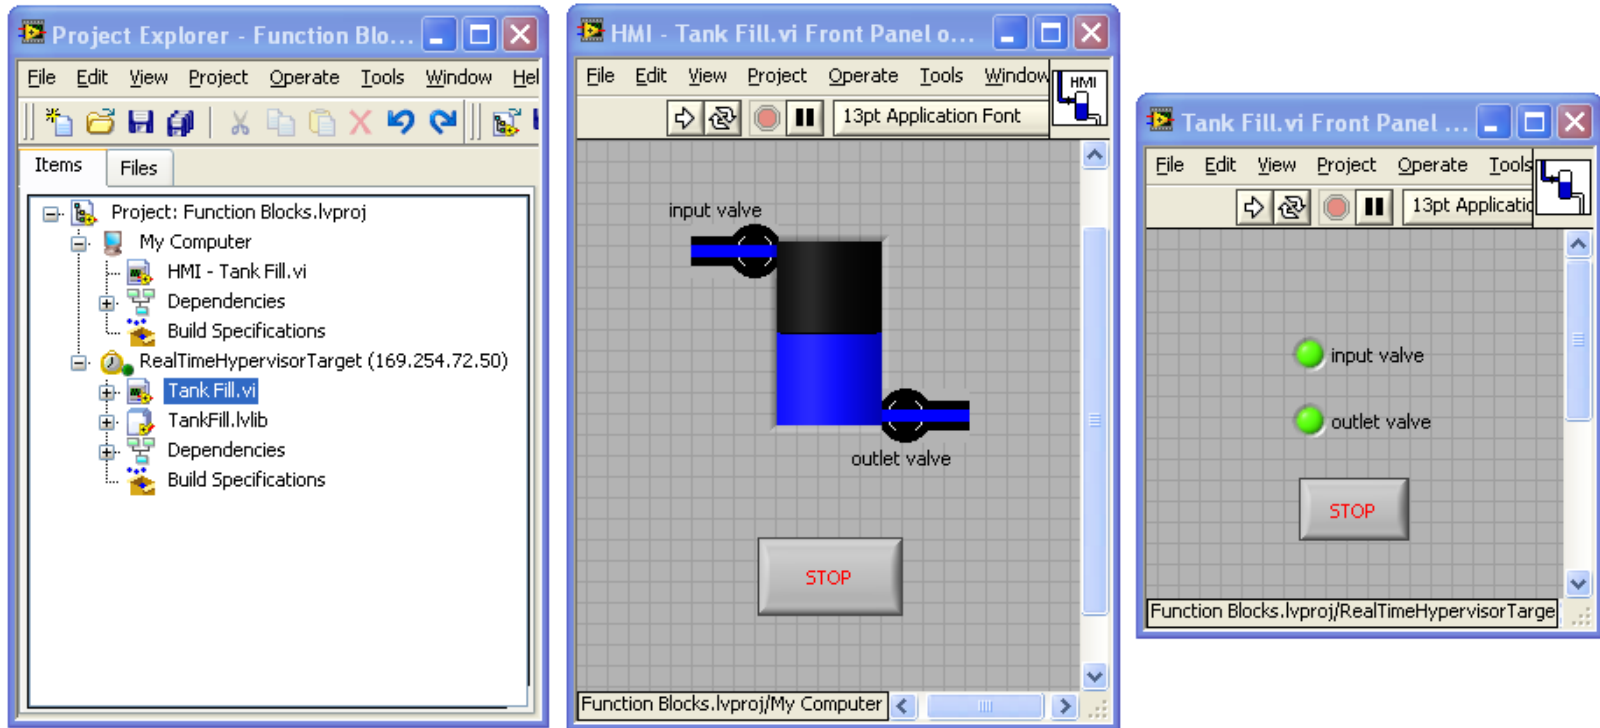

# Demo: Exploring Real-Time Hypervisor Features

# LabVIEW Development and Deployment

- Extremely similar to traditional NI real-time systems

# Demo: Deploying an Example LabVIEW Real-Time Application

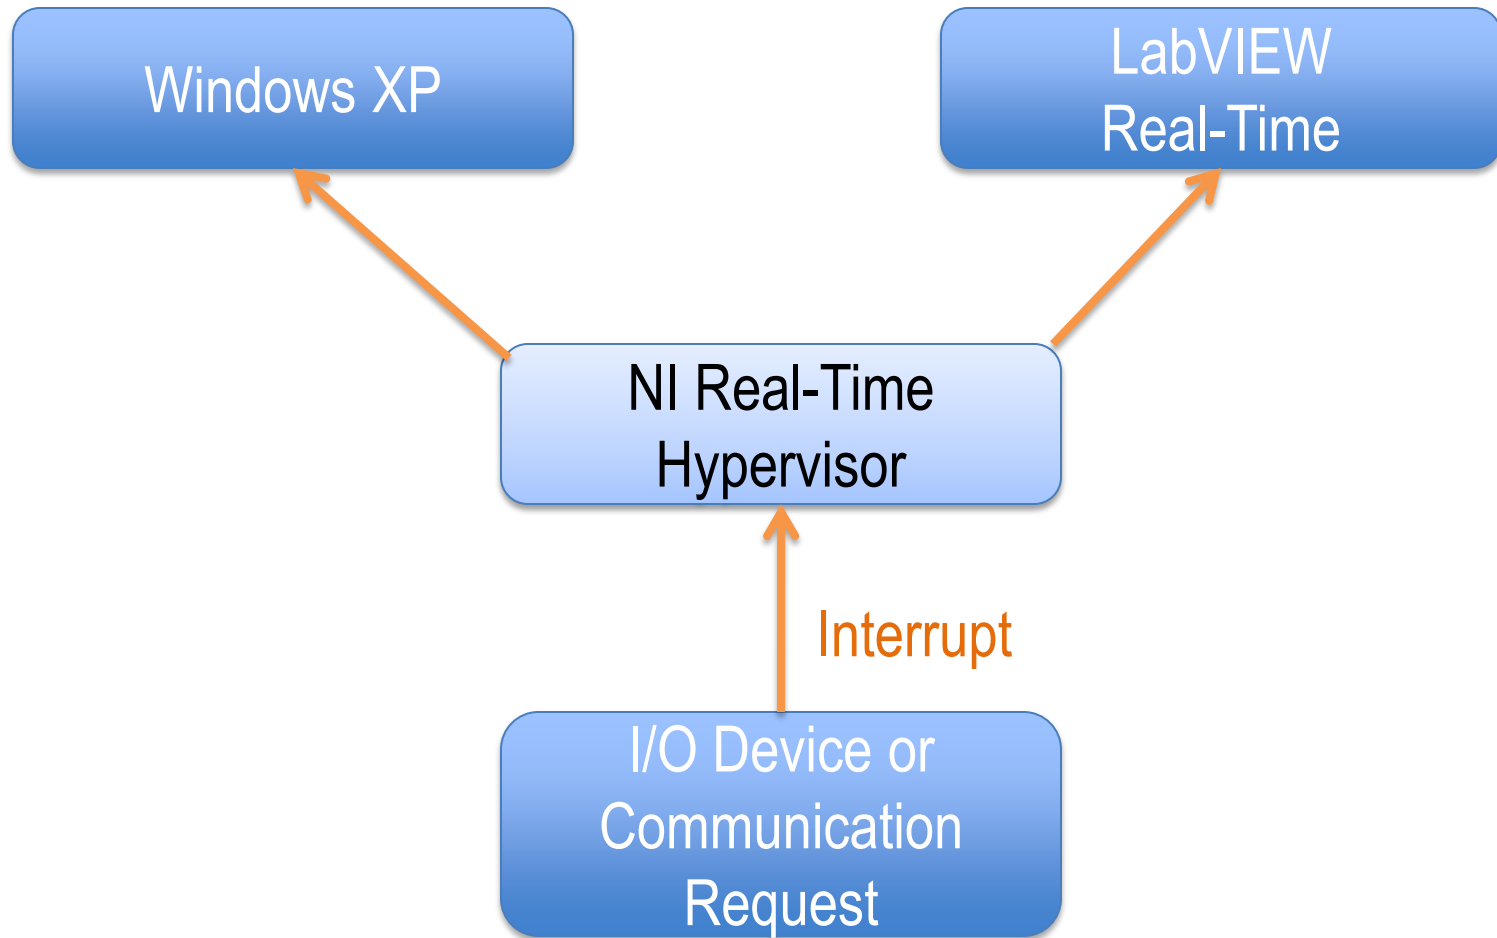

# Performance and Benchmarks

2009 NI Technical Symposium

# Interrupt Latency and Performance Impact

# Benchmarks for Single-Point DAQ Application (Interrupts)

I/O Channels (with PID)	Maximum Loop Rate with Hypervisor (kHz)	Maximum Loop Rate without Hypervisor (kHz)
1	11.5	25.4
4	9.3	22.6
16	7.0	12.4

Use polling to improve I/O performance on hypervisor systems

# Benchmarks for Typical Large DAQ Application (Polling)

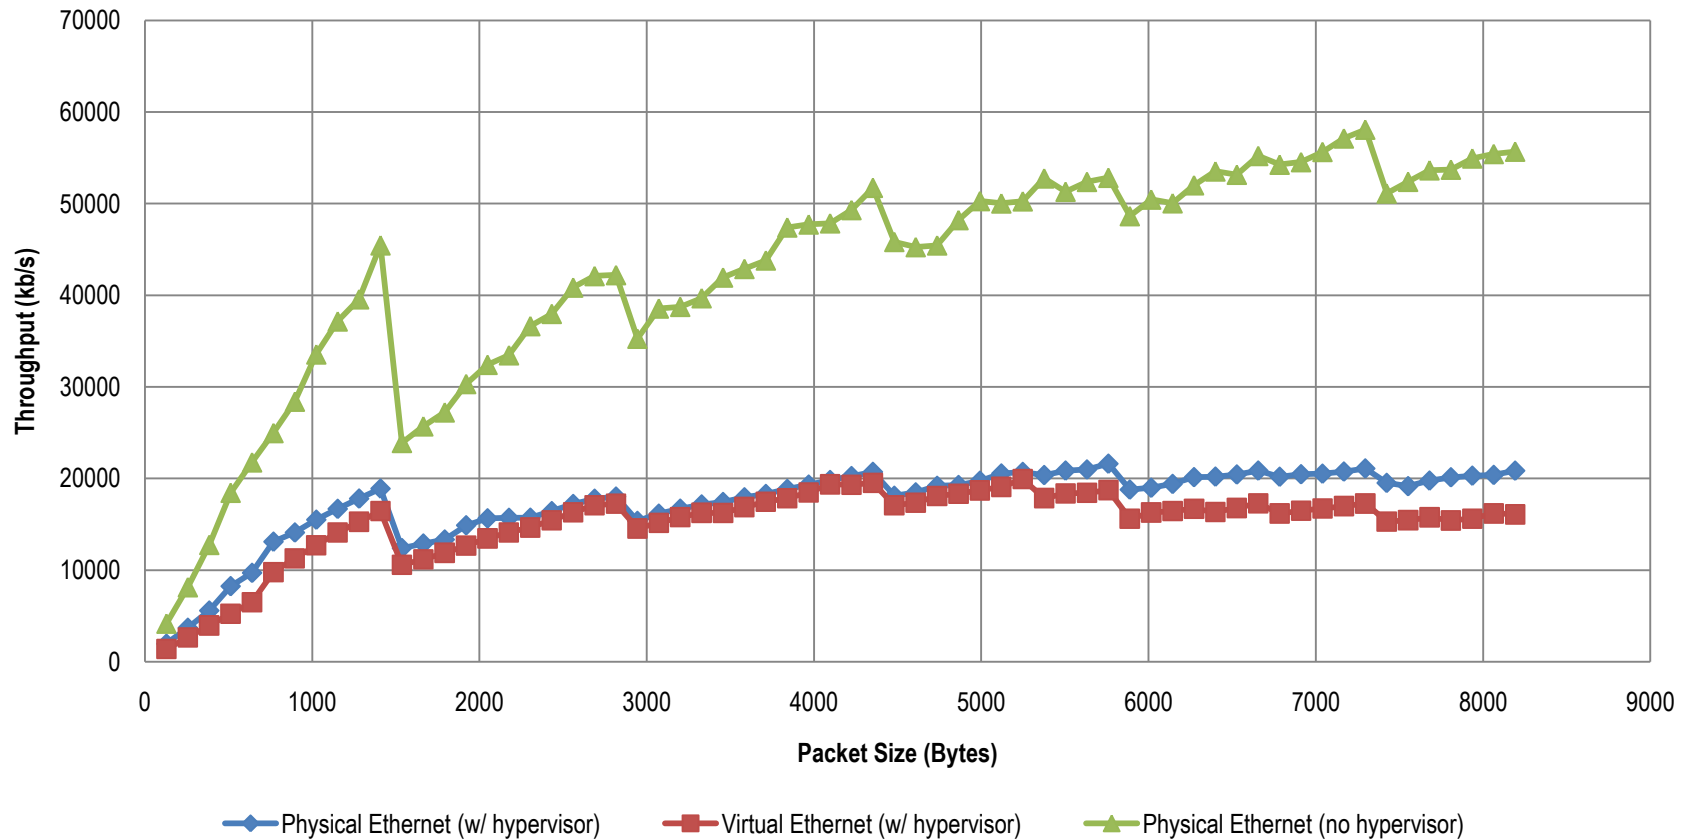

Application	Maximum Loop Rate with Hypervisor (kHz)	Maximum Loop Rate without Hypervisor (kHz)
Large DAQ App.	12.0	14.5

Most LabVIEW Real-Time applications running between 1 and 5 kHz will be able to run at full rate on a Real-Time Hypervisor system

# Communication Benchmarks

## Throughput on Hypervisor and Nonhypervisor Systems

# Case Study

# Process Automation: Aircraft Arrestor Test System

**Process**   
**Automation** corp.

- Dynamically testing a system to rapidly decelerate jet aircraft
- Combining real-time simulation, I/O, and user interface on one controller
- Reducing cost and footprint using the Real-Time Hypervisor

“By consolidating the components of our real-time test system onto one controller, the NI Real-Time Hypervisor will reduce our hardware cost and lower our application footprint.”

– Greg Sussman, Process Automation

# NI Real-Time Hypervisor Ordering Information

- Real-Time Hypervisor and OS software preinstalled
- Supported hardware
  - NI PXI-8108 and PXI-8110
  - NI 3110 industrial controller
- \$499 USD (Real-Time Hypervisor Deployment License only)

# Additional Resources

- NI virtualization portal ([ni.com/virtualization](http://ni.com/virtualization))
  - Background on virtualization technology
  - Real-Time Hypervisor virtual tour
  - Architecture details, benchmarks, and programming recommendations
